

# Dynamic reporting Dashboard

Microsoft Excel FORMULAS & FUNCTIONS

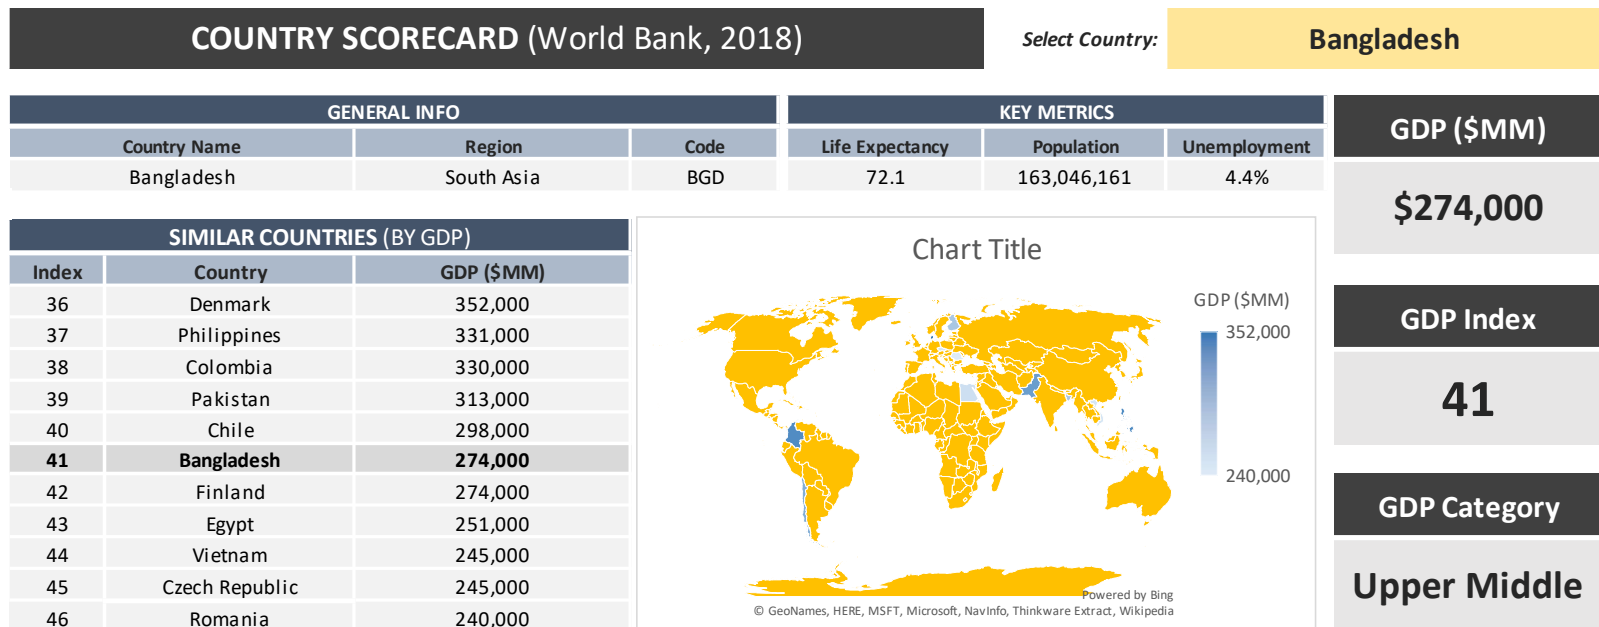

Prepared by: Sabbir Hossain

## Dataset Overview

The **Country Scorecard** is an interactive Excel dashboard developed using the **World Bank 2018 dataset**. Its purpose is to allow users to select any country and instantly view its key economic and demographic indicators, GDP classification, nearby economies by GDP, and a geographic visualization.

The dashboard was designed using modern Excel features to provide a dynamic reporting experience without manually changing formulas.

# COUNTRY SCORECARD (World Bank, 2018)

This project is an interactive Country Scorecard built using World Bank 2018 data in Excel. The user selects a country from a dropdown, and the dashboard automatically displays its general information, key economic indicators, GDP category, and similar countries by GDP. I used XLOOKUP, INDEX, IF, structured references, Excel Tables, Data Validation, and a Filled Map Chart to create a dynamic dashboard. One feature I'm particularly proud of is the dynamic metric selector, where a single formula returns different columns—such as GDP, Population, or Life Expectancy—based on the selected header. This approach reduces duplicate formulas and makes the dashboard easier to maintain.
