Text Functions

Fixed & relative references use a dollar sign (\$) to determine how row and column references change when formulas are copied to new cells:

- **Relative** (A1): Both the column (A) and row (1) references can change
- **Fixed** (\$A\$1): Neither the column (A) nor the row (1) reference can change
- **Mixed** (\$A1, A\$1): Row *or* column references may change, depending which one is fixed

Relative Column, Relative Row

	A	B	C
1	A1		
2			
3			C3

Fixed Column, Fixed Row

	A	B	C
1	\$A\$1		
2			
3			\$A\$1

Fixed Column, Relative Row

	A	B	C
1	\$A1		
2			
3			\$A3

Relative Column, Fixed Row

	A	B	C
1	A\$1		
2			
3			C\$1

PRO TIP: Press **F4** to cycle between reference types

Text Functions

Explicit references are the traditional A1-style cell references Excel uses by default

Structured references are applied when you reference cells within Excel tables (vs. *ranges*), and include entire table and column names rather than individual cells

EXPLICIT REFERENCE:

X ✓ fx		=SUM(D2:D13)			
C	D	E	F		
Month	Flights		Total		
Jan	389		4,985		
Feb	356				
Mar	405				
Apr	391				
May	448				
Jun	417				
Jul	476				
Aug	457				
Sep	437				
Oct	405				
Nov	390				
Dec	414				

Create Table ? X

Where is the data for your table?

SC\$1:SD\$13

☒ My table has headers

OK Cancel

STRUCTURED REFERENCE:

X ✓ fx		=SUM(Trend[Flights])			
C	D	E	F	G	
Month	Flights		Total		
Jan	389		4,985		
Feb	356				
Mar	405				
Apr	391				
May	448				
Jun	417				
Jul	476				
Aug	457				
Sep	437				
Oct	405				
Nov	390				
Dec	414				

Table Name: Trend
